3.23 – Smart Card Redirection

Since version 5.7, Java applet was deprecated. Smart Card redirection need a small native application (sg_agent.exe for Windows, sg_agent.zip for macOS) running on user's machine to communicate with Smart Card.

Local hardware (smart card, scanner) redirection needs an agent (native application) running on your computer to acees the local hardware. Please:

1. Download the agent from your installation: http://localhost:8080/sg_agent.exe
2. Run the agent and keep it running during the connection (you only need to run the agent once for multiple sessions).
3. Click the "Open" button to open a new window (bridge.html) to communicate with the agent and keep it open during the connection.

You also need to add the "&smartCard=on" parameter to your websocket URL to enable smart card redirection. Use the "&passwordIsPin=on" parameter if you want to transfer password as the PIN of smart card.

If the green smart card icon is displayed in the traybar, the implementation was successful:

---

smart card, smartcard, hardware token, hardwaretoken
