Appendix F – configuration for Juniper, Cisco, Dell etc SSL VPN

It's very easy if the VPN supports WebSocket. You just need to create a web application resource profile (bookmark) or application offloading and specify the URL of the gateway.

Make sure you update SparkView to 4.8.6 or later which improved the compatibility of SSL VPN.

You can enable HTTP Basic Authentication in SparkView for VPN SSO integration (set authorization = Basic in gateway.conf).

SparkView also supports HTTP Post integration. Please specify your URL as http://yourGateway/CONNECT. Please also check html\examplePost.html for reference.
